## ANTIGEN/ANTIBODY SPECIFICITY EXCHANGER

5 The present invention relates to an antigen/antibody specificity exchanger, which comprises an amino-acid sequence which specifically binds to a certain antigen linked to an amino-acid sequence to which a certain antibody binds. In vitro the  
10 antigen/antibody specificity exchanger of the invention can be used as a diagnostic reagent instead of antisera or monoclonal antibodies in testing systems, and in vivo it can be used to redirect antigens or antibodies to other antibodies or antigens, respectively, than they were originally directed to.

Background

During the past decade the antigenic structure of several viral proteins have been characterized using synthetic peptides, such  
20 as the human immunodeficiency virus-1 (HIV-1) gp160, and the hepatitis B virus core/e antigens (HBc/eAg). Recently it has been shown that a synthetic peptide corresponding to the complementarity determining region 3 of the heavy chain (CDRH3) of a monoclonal antibody (mAb; F58), directed to the variable  
25 third (V3) domain of HIV-1 gp160, may act as a mini antibody and neutralize HIV-1 in vitro. In the experimental part of the present specification, the construction of synthetic peptides combining the CDRH3 domain of the mAb F58, or CDRH1, CDRH2, CDRH3 domain of Ab C1-5, and antigenic regions derived from the HIV-1  
30 gp41, HBc/e antigen, hepatitis C virus (HCV) core protein or from the poliovirus VP1, is shown. These peptides specifically bound the V3 domain of HIV-1. Thus, it was possible to modify the antigenic surface of HIV-1 V3 peptides. This antigen/antibody specificity exchanger will be used for redirecting the reactivity  
35 of circulating antibodies and using already existing antibody specificities for a predetermined purpose. It may also serve to

alter the composition of the surface of proteins by the addition of foreign determinants. For example, the widely used poliovirus vaccination, together with the high rate of seropositivity to enteroviral proteins may be a suitable pool of antibodies to  
5 redirect against other pathogens, such as HIV.

The complementary determining regions (CDRs) of antibodies are responsible for the specificity of the antibody (1,2). X-ray crystallography has shown that the three CDRs of the variable  
10 (V) region of the heavy chain and the three CDRs of the V region of the light chain may all have contact with the epitope in an antigen-antibody complex (3). Single peptides corresponding to the CDRs of mAbs to various antigens have been shown to mimic the recognition capabilities of the respective mAb (4-10). Recently  
15 it was shown that a peptide corresponding to CDRH3 of a mAb specific for the V3 region of human immuno deficiency virus-1, holds neutralizing capacity when assayed in vitro (9). It was also observed that the CDRH2 of a mAb to hepatitis B core antigen (HBcAg) is capable of capturing HBcAg (10).

20

#### Description of the invention

The present invention is, in one aspect, directed to an antigen/antibody specificity exchanger, which comprises  
25 A) an amino-acid sequence corresponding to an amino-acid sequence of an antibody which specifically binds to a certain antigen, including hapten,  
B) linked by a link to  
C) an amino-acid sequence to which a certain antibody binds.

30

The amino-acid sequence of A) may comprise additional amino acids or sequences on one or both sides of the amino-acid sequence of an antibody which specifically binds to a certain antigen, including hapten. Such additional amino acids and sequences may  
35 be, but are not limited to, the amino acids and sequences naturally occurring in said antibody as extensions to the amino-

acid sequence of A). The number of amino-acid residues in the amino-acid sequence of A) is preferably at least 5, and is together with possible extensions preferably less than 35.

- 5 Further, the amino-acid sequence of C) may comprise additional amino acids or sequences on one or both sides of the amino-acid sequence to which a certain antibody binds. Such additional amino acids and sequences may be, but are not limited to, the amino acids and sequences naturally occurring as extensions to the
- 10 amino-acid sequence of C). The number of amino-acid residues in the amino-acid sequence of C) is preferably at least 5, and is together with possible extensions preferably less than 35.

- In an embodiment of the above aspect of the invention said
- 15 antigen/antibody specificity exchanger of the invention is one wherein said amino-acid sequence of A) corresponds to an amino-acid sequence of a complementarity determining region (CDR) or a framework region of a certain antibody.

- 20 In a further embodiment said antigen/antibody specificity exchanger of the invention is one wherein said amino-acid sequence of C) corresponds to an antibody-binding region of a certain protein, such as one of viral, bacterial or fungal origin.

- 25 In another embodiment said antigen/antibody specificity exchanger of the invention is one wherein said amino-acid sequence of A) is linked to said amino-acid sequence of C) by a link B), which is selected from the group consisting of a direct peptide bond and
- 30 spacer molecules, such as an amino acid, an amino acid having two amino groups, linear or branched peptides or polypeptides and biotin-avidin-biotin.

- In a preferred embodiment said antigen/antibody specificity
- 35 exchanger of the invention is one wherein said amino-acid sequence of A) is selected from the group consisting of

Another aspect of the invention is directed to a diagnostic reagent comprising an antigen/antibody specificity exchanger  
10 according to the invention.

Such a diagnostic reagent of the invention may be used to detect in vitro specific antigens in biological samples, e.g. body fluid or tissue samples. Thus, the diagnostic reagent of the invention  
15 may be used instead of antisera or monoclonal antibodies in in vitro testing systems, such as immunological tests, e.g. Enzyme-Linked Immunosorbent Assay (ELISA), Enzyme Immunoassay (EIA), Western Blot, Radioimmunoassay (RIA) etc. Further, the diagnostic reagent of the invention may be used to investigate biological  
20 properties of biological systems.

Still another aspect of the invention is directed to a method of treating a disease or disorder caused by a known antigen in an individual in need of an increased number of antigen-specific  
25 antibodies, which comprises administration to said individual of a sufficient amount of a tailor-made antigen/antibody specificity exchanger according to the invention which binds to certain antibodies known to exist in said individual.

30 An individual in need of an increased number of antigen-specific antibodies against a known antigen, which causes a disease or disorder in said individual, may be one who will benefit from getting a rapid increase in the number of such antigen-specific antibodies, or who even lacks or has insufficient ability to  
35 elicit antibodies against said known antigen. Said individual may be a human or non-human mammal.

Such a tailor-made antigen/antibody specificity exchanger according to the invention is designed so that certain antibodies existing in the patient in question, (e.g. antibodies against viral proteins, such as antibodies against poliovirus, antibodies against virus causing measles, antibodies against hepatitis B virus, antibodies against hepatitis C virus, antibodies against HIV-1, whether induced by natural infection or vaccination) binds to the amino-acid sequence of C) and the amino-acid sequence of A) binds to a known antigen causing a disease or disorder in said patient (e.g. HIV).

Thus, existing antibodies in said patent are redirected to said known antigen (against which said patient e.g. lacks or has insufficient amount of desired antibodies).

A specific example of an antigen/antibody specificity exchanger of the invention is a peptide which binds to antibodies against poliovirus and also binds specifically to HIV virus. Thus, already high titres in a patient of antibodies against poliovirus may thus be used to fight HIV infection in said patient.

#### Preparation of the antigen/antibody specificity exchanger of the invention

The antigen/antibody specificity exchanger of the invention is prepared in any suitable manner known in the art. It is in most cases a peptide, with the exception of the case when it comprises biotin-avidin-biotin as a linker. As is well-known in the art, peptides can be produced by genetic engineering methods or peptide synthesis. In peptide synthesis one amino-acid residue is coupled to the next one in liquid phase, or starting with the solid phase to which the C-terminal of the first amino acid is coupled, whereupon the C-terminal of the next amino acid is coupled to the N-terminal of the first amino acid, etc, finally releasing the build-up peptide from the solid phase.

The antigen/antibody specificity exchangers presented in Table 1 are all synthetic peptides synthesized according to a method for multiple peptide synthesis (21) and by a Milligen 9050 peptide synthesizer using 9-fluorenylmethoxy-carbonyl-protected amino acid esters (20). All peptides were analysed and/or purified by reverse phase HPLC using a Pep-S 5m column (Pharmacia-LKB, Uppsala, Sweden), run with a gradient from 10% to 60% CH<sub>3</sub>CN against water containing 0.1% trifluoro-acetic acid.

10 Testing of the antigen/antibody specificity exchanger of the invention

Monoclonal antibodies and human sera. The production and characterization of mAb to HBc/eAg has been described (15, 18).

- 15 The mAb 14E11 recognizes the epitope at residues 135-141 (PNAPILS), of the HBc/eAg sequence (15). The monoclonal antibody 14E11 was kindly provided by Dr. Alexander Cimanis, Riga. Two human sera (A and B) reactive to a peptide covering residues 42-55 of VP1 of poliovirus 1 have previously been described (19).
- 20 A monoclonal antibody against enteroviral VP1 was purchased from Dako (CBV; M7064, Dako, Copenhagen, Denmark)

- Three human sera (C, D and E) positive for antibodies to hepatitis C virus (HCV) core residues 7-19 have previously been described (20).

- Enzyme immuno assays (EIAs). Strain-specific HIV-1 V3 peptides were coated on microtiter wells (Nunc 96F Certificated; Nunc, Copenhagen, Denmark) in 100 µl portions at concentrations of from 10 mg/ml to 0.01 mg/ml in 0.05 M sodium carbonate buffer, pH 9.6, at +4°C overnight. Excess peptides were removed by washing with PBS containing 0.05% Tween 20.

- The peptide-coated plates were assayed for binding using the peptides of the invention diluted from 100 mg/ml to 0.01 mg/ml in PBS containing 1% BSA, 2% goat serum, and 0.05% Tween 20. The dilutions of the peptides of the invention were added in 100 µl

portions and incubated with the adsorbed V3 peptides for 60 minutes at +37°C. Excess test peptides were removed by washing and bound peptide was indicated by the respective mAb or anti-serum, by incubation for 60 minutes at +37°C. The amount of bound antibody was indicated by an additional incubation of enzyme-labelled secondary antibody, rabbit anti-mouse Ig (P260, Dako, Copenhagen, Denmark) for mAbs, and goat anti-human IgG (A-3150; Sigma Chemicals, St. Louis, MO) for human antibodies. The amount of bound conjugate was determined by addition of substrate and the absorbances were measured at 492 nm or 405 nm in a spectrophotometer.

Antibody recognition of peptides of the invention. When adsorbed to microplates all peptides of the invention presented in Table 1 except for Nos. 4 (Table 2) and 7 (data not shown) were found to be reactive with the respective antibodies.

Antigen binding of the peptides of the invention. The antigenically functional test peptides were further evaluated for binding of HIV-1 V3 peptide, MN-strain. All test peptides which had a functional antigenic region were found to directly bind to the HIV-1 V3 peptide (Tables 3 and 4). As shown in Tables 3 and 4, the reactivity to the HIV-1 V3 peptide was found to be dependent on both concentrations of the test peptides and of V3 peptides, indicating a specific reactivity. This clearly indicates that it was possible to redirect antibodies specific for HIV-1 gp41, HBc/eAg and poliovirus 1 VP1 to bind to the altered antigenic surface of the HIV-1 V3 peptide. It was also found, that pre-incubation of equimolar concentrations of mAb 14E11 and the corresponding test peptide of the invention, did not change the ability of the test peptide mAb complex to bind to the V3 peptide (data not shown). This indicates that it is possible to add antigenic domains to a CDR peptide with retained antigen binding ability of the CDR sequence.

The ability of the antigen/antibody specificity exchangers to redirect antibodies was further evaluated in a system where the CDRH1, CDRH2 and CDRH3 sequences from mAb C1-5 were added to the epitope sequence for mAb 14E11. A peptide corresponding to the epitope sequence for mAb C1-5, residues 71-90 of HBc/eAg with an Ile at position 80, was adsorbed to microplates. The antigen/antibody specificity exchangers, based on the C1-5 CDRs, were then added, and the amount bound CDR peptide was indicated by the epitope specific mAb 14E11. The results clearly showed that the mAb 14E11 which originally recognized residues 134-141 of the HBc/eAg sequence was redirected by the antigen/antibody specificity exchanger containing the CDRH2 sequence (Table 5). Also, this reactivity was dependent on the amount CDR added, indicating a specific reaction ( $p < 0.01$ , Regression analysis; Table 5).

Further, in Table 7 is shown that the antigen/antibody specificity exchanger of the invention can redirect an existing HBc/eAg specific antibody to significantly bind to HIV-1 V3 peptides of several different subtypes.

Thus, it is evident that the antigen/antibody exchanger of the invention forms the basis of a novel method for redirecting the specificity of monoclonal and polyclonal antibodies by modifying the antigenic surface of a viral protein.

It should be understood that the invention comprises antigen/antibody exchangers wherein included amino-acid sequences are chemically stabilized e.g. by cyclization and wherein included amino-acid sequences may have specific amino-acid deletions, additions and/or substitutions. Such modified amino-acid sequences may result in antigen/antibody exchangers exhibiting increased (or decreased) biological activities.

Table. 1. Antigen/antibody specificity exchangers of the invention represented by peptides containing the CDRH3 domain of mAb F58 or CDRH1, CDRH2, CDRH3 domain of mAb C1-5 (A) and different antigenic regions derived from viral proteins (C).

## CLAIMS

5

10

15

20

25

30

1. Antigen/antibody specificity exchanger, characterised in that it comprises
  - A) an amino-acid sequence corresponding to an amino-acid sequence of an antibody which specifically binds to a certain antigen, including hapten,
  - B) linked by a link to
  - C) an amino-acid sequence to which a certain antibody binds.
2. Antigen/antibody specificity exchanger according to claim 1, wherein said amino-acid sequence of A) corresponds to an amino-acid sequence of a complementarity determining region (CDR) of a certain antibody.
3. Antigen/antibody specificity exchanger according to claim 1, wherein said amino-acid sequence of C) corresponds to an antibody-binding region of a certain protein.
4. Antigen/antibody specificity exchanger according to claim 1, wherein said amino-acid sequence of A) is linked to said amino-acid sequence of C) by a link B), which is selected from the group consisting of a direct peptide bond and spacer molecules.

5. Antigen/antibody specificity exchanger according to claim 2, wherein said amino-acid sequence of A) is selected from

5 SEQ ID NO: 1:

Cys Asp Leu Ile Tyr Tyr Asp Tyr Glu Glu Asp Tyr Tyr Phe

SEQ ID NO: 2:

10 Cys Asp Leu Ile Tyr Tyr Asp Tyr Glu Glu Asp Tyr Tyr

30

Cys Asp Leu Ile Tyr Tyr Asp Tyr Glu Glu Asp Tyr Tyr Gln Arg Lys

Thr Lys Arg Asn Thr Asn Arg Arg.

- 5 9. Antigen/antibody specificity exchanger according to claim 4, wherein said spacer molecules are selected from an amino acid, an amino acid having two amino groups, linear or branched peptides, polypeptides and biotin-  
avidin-biotin.
- 10 10. Diagnostic reagent comprising an antigen/antibody specificity exchanger according to any one of claims 1-9.
- 15 11. A method of treating a disease or disorder caused by a known antigen in an individual in need of an increased number of antigen-specific antibodies, which comprises administration to said individual of a sufficient amount of a tailor-made antigen/antibody specificity exchanger according to claim 1 which binds to certain antibodies known to exist in said individual.

## INTERNATIONAL SEARCH REPORT

International application No.  
PCT/SE 95/00468

<b>A. CLASSIFICATION OF SUBJECT MATTER</b>		
IPC6: C07K 16/00, C07K 19/00, A61K 39/395, G01N 33/05, C12N 15/13 According to International Patent Classification (IPC) or to both national classification and IPC		
<b>B. FIELDS SEARCHED</b>		
Minimum documentation searched (classification system followed by classification symbols)		
IPC6: C07K, A61K, G01N		
Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched		
SE,DK,FI,NO classes as above		
Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)		
MEDLINE, BIOSIS, SCISEARCH		
<b>C. DOCUMENTS CONSIDERED TO BE RELEVANT</b>		
Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 5196510 A (JOHN D. RODWELL ET AL), 23 March 1993 (23.03.93), see column 18-28 and claims --	1-4,6,9,10
X	US 5091513 A (JAMES S. HUSTON ET AL), 25 February 1992 (25.02.92), column 2 - column 3 --	1-4,6,9,10
X	National Library of Medicine, file Medline, Medline accession no. 93380831, Bianchi E: "Affinity purification of a difficult-sequence protein. Implications for the inclusion of capping in synthetic protocols", Int J Pept Protein Res 1993 Jul;42(1):93-6 --	1-4,6,9,10
<input checked="" type="checkbox"/> Further documents are listed in the continuation of Box C. <input checked="" type="checkbox"/> See patent family annex.		
* Special categories of cited documents: "A" document defining the general state of the art which is not considered to be of particular relevance "E" earlier document but published on or after the international filing date "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified) "O" document referring to an oral disclosure, use, exhibition or other means "P" document published prior to the international filing date but later than the priority date claimed "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention "X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone "Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art "&" document member of the same patent family
